Structure and systems

Structured content

Content broken into meaningful parts so it can be managed, reused and presented in different ways.

Structured content

Structure and systems

Structured content is content stored as separate, labelled parts, such as title, summary, steps, date or outcome, so each can be managed and reused. Done well, it makes the structure explicit without making the writing formulaic. When an event's date, venue and booking link are separate fields, they can feed the newsletter, the listings page and the calendar invite at once.

Why it matters for content

Structured content lets you publish the same material in more than one place, change the presentation without rewriting the source and manage content at scale without everything dissolving into copy and paste. A change of venue gets made once. It matters most where content travels across several channels, or where a team wants to move beyond publishing one page at a time.

How AI changes the picture

Machines work far better with structure that's explicit than with structure implied in prose. If the content is one blob, a system has to guess which part is the key message, the action or the evidence. Those guesses are often wrong, and the errors travel into every summary built on them. Linking a finding to its method and caveats helps keep claims attached to their conditions.
